ddimage file in to the wl.bin file in the Flash/ISO folder under the wl.proceeding folder.3) Boot into windows (some may need to restart to run the firmware upgrade). Open wl.bin and erase the file. Save the file and then do another reboot.4) Install the new firmware by opening up wl.proceeding and flashing the firmware using the firmware updater of your device. Run all applications (browsers etc) and internet connection before connecting the device to your router. PLEASE DO NOT ATTEMPT TO UPDATE THE FIRMWARE IN WINDOWS OR ANY OTHER SOFTWARE PROGRAM. However, if your router does not support this option, you can disable the Web interface on the router and this will result in a reset when you turn on your system. This will allow you to perform the firmware update directly from your system. Please note that using dd-wrt is not the same as following the instructions below. Once you install the dd-wrt router firmware and follow the instructions below, please be advised that you will need to manually install updates to the router firmware after flashing the firmware. After installing the new firmware, you will need to log back into the router via its Web interface by going to 192.168.1.1 and entering the administrator password. 2. Flash the router's firmware image (contained on the Windows.ISO file that is provided) to the hard disk partition using any tool that supports DDI files. During this step the system will automatically reboot, wait for the POST, and then restart. 3. If a RSA file is present on the router, you need to enter the username and password provided in that file. Once that is done, enter the password for the Web interface in order to log in. 4. Now you will need to install the new firmware to the hard disk partition. The process is similar to the process of flashing the router's firmware mentioned in the first step. Before proceeding, verify that you have the correct hard disk partition for the router. (If you are unsure, find out from your router how to identify your hard disk). If the partition is correct, connect the router to a computer and select the "Connect" option to the router. As the router boots up, you will be prompted to select the hard disk that is partitioned to the router (if you do not have a hard disk installed in the router then the first step of flashing the router 82157476af
