Interfacial perturbation theory In condensed-matter physics, interfacial perturbation theory is the semiclassical theoretical framework for studying a 2D electron gas (2DEG) at zero temperature and charge neutrality in a uniform and weakly varying potential for magnetic fields normal to the 2DEG. It was developed by Ashcroft and Mermin. Formulation The 2DEG is an idealized 2D system composed of electrons and holes at the surface of a semi-conducting substrate, in the presence of a weak and homogeneous background doping. The electrons and holes are assumed to move on a parallel plane and their motion is coupled by Coulomb interaction. The interaction of the 2DEG electrons with the background charges and spins is described by a Hamiltonian involving a term describing their mutual interaction (in the presence of a magnetic field), and another describing the interaction between their motion and the background charges and spins. The 2DEG electrons move along the 2DEG interface as if in an electric field, created by the potential difference between the 2DEG and its background charge density. The electrons can hop through the potential barrier formed by the 2DEG/background charge interface, provided that they satisfy the energy conservation condition that implies that the states of the 2DEG electrons with energy ϵ above the potential barrier height V must be weighted by the probability α with $E \leq V$. This energy conservation condition can be reformulated as an equation for the electron energy ϵ that depends on its energy at the bottom of the potential well (ϵ_0) and on the potential barrier height V . The 2DEG electrons are described by a Fermi-Dirac distribution, whose particles satisfy the inequality for all values of the energy, whereas the background charges and spins are described by a Maxwell-Boltzmann distribution, whose particles satisfy the inequality for all values of energy. In the low-temperature limit, the equation for the electron energy takes the form with the temperature of the 2DEG electrons, while the wave function of the 2DEG electrons is expressed as where the integral is performed over the relevant part of the region in which the electron hops between the 2DEG and the background charge layers. The integration path is taken between the points, and. The wave functions in the 2DEG region, as well as the potential barriers, can be approximately described by a quad

Photo by Jerry Teel Brushes Brushes are the most widely used tool in Photoshop. You can use them to fill out an area with any color, pattern or texture. We can also use a brush as a brush tool. In this case, we are applying a brush, but aren't necessarily filling it with a specific color or applying a pattern or texture. Instead, we paint on the image like a painter would, using different tools to make our image look the way we want it to. The Brush tool The Brush tool allows you to paint your image, like a painter. You can choose your brush type, size, opacity, and paint on your image. The Brush tool's menu has a Brush panel where you can select a brush, set its size, apply a texture, and edit its settings. To paint with this tool, you can draw directly on the canvas or open up a Layers panel and click the Brush icon to paint with that tool. You can also use the regular Brush tool to create a Layer Mask in this way. The Eraser tool The Eraser tool can be used to erase selected areas of an image. You can use it to clean up an image, create a completely blank image, or remove unwanted objects or areas. The Eraser tool is located on the Edit tab, and is one of the best tools in Photoshop to erase unwanted areas of an image. We can use it to remove the extraneous parts of an image, change the background, and erase unwanted areas. You can either erase an object by itself or use the Eraser tool as an eraser to erase a specific object. The Eraser tool has three different levels: Eraser: This is the most basic level. It allows you to erase a single area of an image at a time, like a pad of paper, and you can select any object or layer on your image. Eraser 2: This is a next-level eraser, and allows you to erase an object or layer in an easy-to-erase circle. You can select any area to erase with this tool. You can choose the size of the eraser by clicking the Eraser button and moving the cursor inside the eraser, or you can click the Eraser button and type in a size. Eraser 3: This is the newest eraser. It allows you to erase anything selected, like a pen or other drawing tool. You can choose the erase object by clicking the
